Framingham Risk Score for Hard Coronary Heart Disease

Estimates 10-year risk of heart attack in patients 30-79 years with no history of CHD or diabetes.

INSTRUCTIONS

There are several distinct Framingham risk models. MDCalc uses the 'Hard' coronary Framingham outcomes model, which is intended for use in **non-diabetic** patients age 30-79 years with no prior history of coronary heart disease or intermittent claudication, as it is the most widely applicable to patients without previous cardiac events. See the official Framingham website for additional Framingham risk models.
